Today, instant and uninterrupted airborne communications is a must. Starling is a leading innovator in the field of connectivity and the first company to deliver a proven technological breakthrough: the MIJET Family of antenna systems — the only low-profile, 2-way Ku-band antenna system for all size aircraft, enabling unprecedented in-flight entertainment and personal communication services.

Starling Advanced Communications was founded in 2003. Headquartered in Yoqneam, Israel, the company's multi-disciplinary R&D team is comprised of highly experienced communications, aviation and electronics specialists and system and design engineers.

Key Enabling Technologies for Airborne Broadband

The Starling MIJET Family of antennas is based on our revolutionary Coherent Multi Panel Antenna (CoMPA) technology and was especially designed to fit airlines strict requirements for safety, operational efficiency and performance. The MIJET Family is comprised of three ultra-small, lightweight bidirectional Ku band antenna systems:

- ▶ MIJET antenna system for any wide or narrowbody aircraft.
- ▶ MIJETLite antenna system for any narrowbody aircraft
- ▶ MiniMIJET, half the size of MIJET, an antenna system for medium and small-size business aircraft.

With the Starling MIJET Family of antenna systems your entire fleet can be equipped with the most advanced antenna systems on the market.

The revolutionary antennas enable passengers and business travelers to enjoy home-like and office-like connectivity while they are in the air, from Internet, VPN, PDA and e-mail to VoIP, mobile phones, live TV and much more.

MIJET Family antenna systems are easy to install and maintain, with only one cable connection into the aircraft. All electronic and RF units are housed inside the antenna for optimal ease of installation and maintenance.
