

# STG Aerospace

*Industry Leader in Emergency Lighting and Power Systems*

**S**TG Aerospace is a market-leading producer of emergency lighting and power systems for aircraft worldwide. The U.K.-based company and its U.S. subsidiary deliver innovative systems that are not only safety-critical but slash running costs when compared to traditional, electrical systems.

Despite the current economic climate, STG believes operators are recognizing the long-term cost saving benefits of STG's market-leading systems, and sales are soaring.

STG's leading product is SaFTGlo, a photoluminescent (PL) floorpath marking system which "stores" and simultaneously emits light, giving highly visible emergency exit guidance for up to 16 hours in darkness, after a short period of "charging" with normal cabin lighting. The system needs virtually no maintenance, saving airlines valuable time and money while offering a reliable, essential safety system.

The newest addition to STG's range is WEPPS (Wireless Emergency Primary Power System). It manages and powers emergency lighting systems, using its SecureControl proprietary wireless monitoring and diagnostic capability, yet is a "fit for life" solution that also needs no scheduled maintenance.

Record-breaking sales in 2008, which saw turnover increase more than 11 percent on the previous year to approach £5 million, look set to continue in 2009. A recent run of new clients and additional orders, including one of the company's biggest ever single sales to Thai Airways, is testament to the fact that in tough times operators can invest to cut costs and increase safety.

Engineers should maintain aircraft, not batteries.

WEPPS is a truly revolutionary emergency lighting battery system. At the touch of a button it can interrogate and report on the status of an aircraft's entire emergency lighting system – all in under ten seconds! What's more, the system's battery modules need no charging and no maintenance; and because

they fit to existing battery mountings they are very cost effective to install and run. In fact, a WEPPS system can pay for itself in less than a year. So talk to us today about the substantial savings WEPPS can make for your airline. And let the engineers get on with maintaining your aircraft.
